Decisions under incomplete information – How much do you like to decide?

Sprache/Language: Deutsch/English

Individuals differ in their attitude towards decisions under incomplete information. While some people have no problems with making decisions in ambiguous situations, others are more sensitive and have difficulties to decide when ambiguity is present.

This paper identifies the characteristics of those different types of decision makers. An empirical study analysis how rational or emotional these individuals are and to what extent does sensory input impact their decision-making process.
