The Interaction of Two Senses – A State of the Art
(Frauke Kühn)

Sprache/Language: Deutsch/Englisch
The interaction of two senses, e.g. the visual sense influences the tactile sense and vice versa, gains in importance. Specifically in recent years, numerous studies focus on the interaction between human sensations. Does the color of food affect the taste? How does sound influence the individual’s visual perception?
The current analysis presents a state of the art concerning the papers that deal with so-called cross-modal effects. The analysis focuses especially on the interaction between two senses and presents which variables are influenced by these effects.
